DUKATRACK

So Dukatrack is a inventory management system and a network for SMEs basically local shops .

Problems with the manual system and other sytems of inventory recording and Networking

1. Inefficiency – mainly targeted towards the manual systems. Writing down tasks by hand through is obviously inefficient but for these small local shops typing seems to be more of a bother, since they are used to writing by hand or worse storing in memory. Dukatrack Image recognition sytem will set it apart from other EPOS systems or ERFS .This increases efficiency by reducing the need for manual input.

2.Pricey subscriptions – most EPOS systems have high subcription prices that outweigh the profit that most of the small business. For SME's this ends up being additional losses if they do decide they need it. DukaTrack has an option for free tier for 1 device (which is what most shops can afford).However even for larger enterprise there can be significant savings(for example if they can store there own data on their servers).We will handle cost efficiency by using open source software and self hosting to avoid pricey cloud bills.

3.Networking – Your question is probably how this can be achieved and how it fits (this is probably the distinguishing factor)

NETWORKING MODEL

In this model we have three main components:

1. the shop owners – they are the main customer(our outlier). The Data from the shop owners (those in our network) will be used in our algorithm to find out the most selling products and the cheapest, which we can then aggregate and relay to the customer(still the shop owner) to make better purchase decisions and we could also have shop owners rate products from brand ; bringing us to our second component.

2.The brands – this is where the group bargaining power applies. We offer our customer cheaper than wholesale prices by getting it directly from the factory. The feature that will help us achieve this is called Common Mfuko(CM) ,I could not find a better name, So shops in a specific area can aggregate earnings in order to purchase goods directly from brands and this will also be another earning point for us, remember we hold the data and data is a very powerful weapon in this 21st century, we will charge the brand a fee providing customers (but in a bidding way brands that offer the better deal getter better engagement with the shops) this needs that we grow and grow fast.

3. the platform – basically it will appear to be a social network,an e-commerce platform,an inventory manager(but behind all this complex appearance is a simple and intuitive application for shops and brands to connect and better tracking of data for this platform)

PHASES OF IMPLEMENTATION

Phase 1 — The Tool (what we're building now)
Inventory management, free tier, simple and fast. Get 20-30 shops actually using it daily. This is our proof of concept and our distribution network.
Phase 2 — The Network
Once shops trust us and use us daily, introduce Common Mfuko. Now we have leverage because you have data and active users.
Phase 3 — The Platform
Brand partnerships, data insights, the marketplace layer. This is where the real money is but it requires Phase 1 and 2 to exist first.

Conclusion

It is not just an inventory management application but a tool that connects and thats what sets us apart .Solve actual problems and ten times better than the any solution in the field (Thats engineering).
